DEPARTMENT OF ORAL PATHOLOGY & MICROBIOLOGY
Special Case

Odontogenic Keratocyst

OPD No.: 14983

Biopsy no.B/19/26

Age/Sex: 38 years/ Female

Patient name : Priyanka

Chief Complaint:

Patient complains of pain in the lower right back tooth region since 1 month.

Clinical Examination

No swelling or any other abnormality noted.

OPG revealed radioopaque lesion with well defined margins i.r.t. right posterior tooth region extending from 47 to right side of ramus. Lower border of the mandible was intact

Provisional Diagnosis:

Odontogenic Keratocyst.

Gross Examination:

Received multiple bits of tissue, irregular in shape, greyish white in colour, firm in consistency, measuring approximately 0.7 x 0.3 in size

Histopathology:

H&E stained section shows multiple bits of tissue showing cystic lumen with flakes of keratin and lining epithelium with underlying capsule. The lining epithelium was stratified squamous parakeratinised along with areas of orthokeratinisation. The epithelium was 6-8 layers thick, had flat epithelial connective interface and showed areas of proliferation and corrugation. The basal layer showed palisaded pattern with hyperchromatic nuclei in many areas. Few cholesterol clefts and giant cells were noted in the capsule.

Final Diagnosis:

Odontogenic Keratocyst
